

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (previously presented): An apparatus for creating a tamper-proof document, comprising:

an encoder configured to digitally encode a user-inputted portion of the document as encoded information;

a placement selector configured to select a location on the tamper-proof document to place the encoded information;

an access selector configured to select a level of access for the encoded information;

a processor configured to process, responsive to said access selector, the encoded information;

a printer configured to print the tamper-proof document including the encoded information as a lattice image pattern of glyph marks at the location;

a disambiguation unit configured to determine an angular orientation of the lattice image pattern, the disambiguation unit comprising:

a compositing mechanism configured to composite a subsample of the glyph marks in said lattice image pattern to a composite lattice image pattern; and

a lattice-axis determination mechanism configured to determine a lattice axis for said lattice image pattern from a line fit through centroids of some of a plurality of composite glyphs in the composite lattice image pattern formed by the compositing mechanism; and

a lens apparatus configured to produce a composite image of the document and image information decoded from the encoded information wherein the orientation of the image information is responsive to the disambiguation unit.

2. (previously presented) The apparatus of claim 1, wherein the tamper-proof document is a third-party check.

3-4(canceled)

5. (**currently amended**): A method for creating a tamper-proof document, comprising:

digitally encoding a user-inputted portion of the document as encoded information;

selecting a location on the tamper-proof document to place the encoded information;

selecting a level of access for the encoded information;

processing, responsive to selecting the level of access, the encoded information; [[and]]

printing the tamper-proof document including the encoded information as a lattice image pattern of glyph marks at the location;

determining an angular orientation of the lattice image pattern, the determining further comprising:

forming a composite lattice image pattern having a plurality of composite glyph marks; and

determining a lattice axis for the lattice image pattern from a line fit through centroids of some of the plurality of composite glyph marks in the composite lattice image pattern; and

displaying a composite image of the document and image information decoded from the encoded information wherein the orientation of the image information is responsive to the lattice axis.

6. (previously presented) The method of claim 5, wherein the tamper-proof document is a third-party check.

7. (canceled)

8. (previously presented): The method of claim 5, wherein the user-inputted portion is handwritten.

9. **(currently amended)**: A method for ensuring that a document has not been altered, comprising:

- digitally encoding a user-inputted portion of the document as encoded information;

- selecting a location on the tamper-proof document to place the encoded information;

- selecting a level of access for the encoded information;

- processing, responsive to selecting the level of access, the encoded information;

- printing the tamper-proof document including the encoded information as an area of glyph marks at the location.

- decoding the encoded information as decoded information;

- determining an angular orientation of a lattice image pattern, the determining further comprising:

- forming a composite lattice image pattern having a plurality of composite glyph marks; and

- determining a lattice axis for the lattice image pattern from a line fit through centroids of some of the plurality of composite glyph marks in the composite lattice image pattern; [[and]]

displaying the decoded information as a composite image of the document and the decoded information wherein the orientation of the decoded information is responsive to the lattice axis;

comparing the decoded information with the user-inputted portion; and

identifying the document as altered, when the decoded information is not identical to the user-inputted portion.

10. (original): The method of claim 9, wherein the user-inputted portion is handwritten.

11. (original): The method of claim 9, wherein the decoded information is a graphical recreation of the user-inputted portion.

12. (previously presented): The method of claim 9, wherein the decoding step further comprises placing the document under a viewport of a lens apparatus, wherein the lens apparatus converts the encoded information to decoded information.

13. (previously presented): The method of claim 12, wherein displaying the decoded information further comprises superimposing the decoded information on the document.

14. (previously presented): The method of claim 12, wherein displaying the decoded information further comprises displaying the decoded information outside of the document.

15-16 (canceled)

17. (currently amended): A computer-readable medium containing instructions for controlling a data processing system to perform a method for creating a tamper-proof document, the data processing system when executing the instructions performing the method comprising;

digitally encoding a user-inputted portion of the document as encoded information;

selecting a location on the tamper-proof document to place the encoded information;

selecting a level of access for the encoded information;

processing, responsive to selecting the level of access, the encoded information;

printing the tamper-proof document including the encoded information as a lattice image pattern of glyph marks at the location;

determining an angular orientation of the lattice image pattern, the determining further comprising:

forming a composite lattice image pattern having a plurality of composite glyph marks; and

determining a lattice axis for the lattice image pattern from a line fit through centroids of some of the plurality of composite glyph marks in the composite lattice image pattern; and

displaying a composite image of the document and image information decoded from the encoded information wherein the orientation of the image information [[responsive to the lattice axis]] is responsive to the lattice axis.

18. (original): The computer-readable medium of claim .17, wherein the user-inputted portion is handwritten.

19-29 (canceled)

30. (previously presented): The computer-readable medium of claim 17, wherein the tamper-proof document is a third-party check.
